

What to Expect at Your Genetics Appointment

<http://genetics.kp.org>

Why was I referred to Genetics?

There are many reasons why you may have been referred to Genetics. Here are some common reasons:

- Your doctor noticed physical features that may have a genetic cause.
- You or someone in your family has a medical condition that may have a genetic cause.
- Results from a medical test suggest a genetic condition.
- There is a family history of a genetic condition.
- You are pregnant and may be considering prenatal testing.

What **do I need to do** before my Genetics appointment?

Usually, you don't need to do anything before your appointment. You will be contacted by the Genetics department if any medical information or a medical test is needed before your visit. You are also welcome to contact the genetic counselor if you would like to discuss the referral or have any questions before your appointment.

How do I prepare for a Genetics appointment?

There are a few things you can do to prepare for this visit:

- Write down your questions before your appointment.
- Gather information about your family's medical history.
- Consider having a support person with you to help remember details from the visit (optional).
- If requested, bring copies of non-Kaiser medical records related to your condition or the condition in the family.

Who will I see at my Genetics appointment?

At your appointment you may see a medical geneticist or a genetic counselor or both. Medical geneticists and genetic counselors often work together as a team.

- A medical geneticist is a doctor who specializes in diagnosing and treating conditions with a genetic cause.
- A genetic counselor is a medical professional who provides information, counseling, and support to individuals and families with genetic conditions.

What can I expect at a Genetics appointment?

Your Genetics appointment may be different from a typical medical visit in a number of ways.

Genetic appointments can sometimes last for an hour or longer. Most of the visit is spent talking with the geneticist or the genetic counselor. The discussion may include information about specific genetic conditions and supportive counseling, when needed.

A detailed medical history will be taken. Your medical records are carefully reviewed and you may be asked to verify important details. If you are pregnant or are planning a pregnancy, information about your pregnancy history may be included (including miscarriages and infertility).

Your family history will be reviewed. The genetic counselor will draw a family tree (called a "pedigree"). This shows several generations of your family. You will be asked about any genetic conditions or medical problems in each person. You may also be asked about birth defects and intellectual disability. Your ancestry and ethnic background will be recorded, since some genetic conditions are more common in certain populations. If you are adopted or not in contact with your relatives, you will be asked to share whatever information is available to you.

A physical exam may be done. Not all genetic visits require a physical exam. However, some visits include a physical exam to look for clues that could help in making a diagnosis. This may mean measuring many different parts of the body and taking notes on physical findings.

Tests and additional referrals are sometimes recommended. The geneticist may recommend tests or evaluations to help identify a diagnosis. Examples of these are blood tests, urine tests, x-rays, and eye exams.

What can I expect after my appointment?

The geneticist or genetic counselor will write a report after your visit. This report is in your electronic medical record and can be viewed on kp.org. If a test or evaluation was ordered, you will be told when to expect results and how the results will be shared with you. The geneticist or genetic counselor will let you know if another Genetics appointment is needed.

Please contact us by phone or secure email if you have questions or concerns after your visit. We also encourage you to call us if there are any major changes in your medical or family history. There could be changes in genetic information or new genetic tests available in the future. So, it might help to stay in touch with your genetic provider.
